To get started with Atom, we'll need to get it on your system. This section will go over installing Atom on your system as well as the basics of how to build it from source. Installing Atom should be fairly simple. Generally, you can go to and you should see a download button as shown here: The button or buttons should be specific to your platform and the download package should be easily installable. However, let's go over them here in a bit of detail. Atom follows the standard Mac zip installation process. You can either press the download button from the site or you can go to the Atom releases page to download the atom-mac.zip file explicitly. Once you have that file, you can click on it to extract the application and then drag the new Atom application into your "Applications" folder. When you first open Atom, it will try to install the atom and apm commands for use in the terminal. In some cases, Atom might not be able to install these commands because it needs an administrator password. To check if Atom was able to install the atom command, for example, open a terminal window and type which atom. If the atom command has been installed, you'll see something like this: which atom /usr/local/bin/atom \$ If the atom command wasn't installed, the which command won't return anything; which atom \$ To install the atom and apm commands, run "Window: Install Shell Commands" from the Command Palette, which will prompt you for an administrator password. Atom is available with Windows installers that can be downloaded from or from the Atom releases page. Use AtomSetup.exe for 32-bit systems and AtomSetup-x64.exe for 64-bit systems. This setup program will install Atom, add the atom and apm commands to your PATH, and create shortcuts on the desktop and in the start menu. The context menu Open with Atom in File Explorer, and the option to make Atom available for file association using Open with..., is controlled by the System Settings panel as seen above. With Atom open, click on File > Settings, and then the System tab on the left. Check the boxes next to Show in folder context menus, as well as Show in folder context menus. And you're all set.
